

Homework to Week 1

Statistics: Principle, Methods and R (II)

GAO FENGAN

Week 1, 27 February 2017

The homework is due on Monday, 6 March 2017. Please hand in the solutions to the teaching assistant He Siyuan at the beginning of the lecture.

1. Obtain a $1-\alpha$ confidence interval for estimating the Bernoulli success probability p with observations X_1, \dots, X_n using the following result coming from applying Hoeffding's inequality.

$$\mathbb{P}(\sqrt{n}|\bar{X}_n - p| \geq t) \leq 2 \exp(-2t^2)$$

2. Let $X_1, \dots, X_n \sim \text{Uniform}(0, \theta)$. Let $f(\theta) \propto 1/\theta$. Find the posterior density.
3. Consider the Bernoulli(p) observations

0 1 0 1 0 0 0 0 0 0.

Plot the posterior for p using these priors: Beta(1/2, 1/2), Beta(1, 1), Beta(10, 10) and Beta(100, 100).
