StatsI — Exercise 6

1. Let $Y_1, \cdots, Y_n$ be a sample from a Poisson distribution with mean $\theta > 0$ unknown.
   (a) Let $Y = Y_1 + \cdots + Y_n$. Find the mean, the variance and the distribution of Y.
   (**Hint**: Find out the MGF of Y.)
   (b) Obtain the MLE for θ and its standard error.
   (c) Suppose now that only the first m ($m < n$) observations of the sample are known explicitly, while for the other $n - m$ only their sum, Z say, is known, determine the MLE of θ.

2. Find the maximum likelihood estimator of λ given a random sample from the gamma distribution with density function

$$f(x) = \frac{1}{\Gamma(r)} \exp(-\lambda x) x^{r-1} \lambda^r,$$

   where r is a known constant.

3. Find the maximum likelihood estimator for θ from a random sample from the population with density function

$$f(y; \theta) = \frac{2y}{\theta^2} \quad 0 < y \leq \theta, \theta > 0.$$

   Do not use calculus. Draw a picture of the likelihood.

4. Let $X_1, \cdots, X_n$ be a sample from $U(0, \theta)$, where $\theta > 0$ is an unknown parameter. Find the MLE $\widehat{\theta}$ for θ. Derive the distribution for $\widehat{\theta}$, and, therefore, show that $\widehat{\theta}$ is a consistent estimator in the sense that $\widehat{\theta} \xrightarrow{P} \theta$ when $n \to \infty$.
   (**Hint**: $P\{\max_{1 \leq i \leq n} X_i \leq y\} = \prod_{1 \leq i \leq n} P(X_i \leq y)$.)

5. Let $X_1, \cdots, X_n$ be a random sample from the density function

$$f(x) = \begin{cases} \theta^2 x e^{-\theta x} & x > 0, \\ 0 & x \leq 0, \end{cases}$$

   where $\theta > 0$ is an unknown parameter.
   (a) Find the maximum likelihood estimator for θ.
   (b) Suppose now that only the last $n - m$ ($m < n$) observations of the sample are known explicitly, while for the first m only their sum, $Z = X_1 + \cdots + X_m$, is known. Show that the probability density function of Z is of the form

$$f_Z(z) = \theta^{2m} e^{-\theta z} g(z),$$

   where $g(z)$ is a function independent of θ. Determine the maximum likelihood estimator of θ based on the observations $Z, X_{m+1}, \cdots, X_n$.
   (**Hint**. Find the CDF $F_Z(z)$ first.)

6. Let $X_1, \cdots, X_n$ be a random sample from Bernoulli distribution, i.e. $P(X_1 = 1) = p = 1 - P(X_1 = 0)$, where $p \in (0, 1)$ is unknown. Let $\theta = p^2$.

(a) Find the Cram'er-Rao lower bound for the variance of unbiased estimators for θ.

(b) Find the MLE $\widehat{\theta}$ for the parameter θ.

(c) Show that $E(\widehat{\theta}) \neq \theta$.

7. Let $\mathbf{X} = (X_1, \cdots, X_n)'$ be a sample from distribution $N(\mu, \sigma^2)$. Let $\boldsymbol{\theta} = (\mu, \sigma^2)'$. Find the Fisher information matrix $\mathcal{I}_{\mathbf{X}}(\boldsymbol{\theta})$.

(**Hint**: Use $\theta_2 = \sigma^2$ in your calculation.)
